

Your Excellency,

Greetings for the day.

I am getting more concerned related to Agriculture day by day.

News related to Srilanka, China and Ukraine were more disturbing.

In news, I was able to know that many are dying for food in Srilanka, China and Ukraine.

Initially, Forest Lands got converted to Agricultural Land.

Slowly Industrialization started. Many agricultural lands were utilized for building Industries.

Forest Land getting converted to Agricultural Land and Agricultural Land getting converted to Living Land and for Industrial Purpose started as a trend.

Now, as a mandatory part for the well being of environment and human health, we are maintaining some part of our nation as a forest on a strict basis.

But conditions like drought, heavy rainfall, unexpected motive to sell the agricultural land for industry or real estate due to previous bad experience of the losses suffered would be bringing down the agricultural yield year by year. Finally, this would even effect our nation's well being.

Link related to impact of disasters and crises on Agriculture and Food:

<https://www.fao.org/3/l8656EN/i8656en.pdf>

Today our neighboring countries are suffering due to lack of food.

We would not like to see the same bad condition in our nation or any extremes where one man will eat another man as food.

So growing green food has become the main part of most essential service.

It is best part of our nation to give independence for framers to grow their expected food.

It is also best part of our nation to donate food for neighboring countries whoever requests with real pain.

But going further, we would have to plan collectively through Government for the perfect win-win situation. Perfect win-win situation means: "natural disasters like flood or other issues are foreseen through scientific methods and actions are taken accordingly with an alternate plan through Smart Agriculture system like Drone and Hydroponic Farms".

Link for Hydroponic Farm: <https://www.agritecture.com/blog/2019/10/21/indias-hydroponic-farmers-are-growing-fresh-pesticide-free-produce>

In best interest of our nation, Farmers and Government would have to work in a collaborative mode such that all agricultural yields will be planned to such an extent where we target ourselves to be self-sufficient for selling or donating the required food to rest of other Continents also. When we plan to have farmers and Government in a collaborative mode, we would have to involve army methodology

where reports related to progress will be discussed and action will be taken on each lacuna on weekly basis like Monday Meetings in MNCs.

There could be more lands where Agriculture may have been stopped completely due to lack of human resource who want to serve nation as a farmer. These lands could have become unproductive or it may still have the same productivity rate. If all lands are accounted and wherever Farmers are absent or unable to grow crops due to lack of human resource are recognized, Government will be able to have the best plan to get best yield from all Agricultural lands.

We have faced many unexpected after results soon after COVID-19 and Ukraine-Russia War's Impact on Global Economy. Even within the country there are some impacts on agriculture due to strike for various reasons.

Since these external and internal factors affect the growth of Agriculture in our nation which in turn will affect everyone in the long run, we need to have the collaboration of Farmers with Government Authority to the best extent possible like a company. It is also best for Government to take firm decision for deployment of Farmers from Government side wherever agricultural lands are not utilized in the right way. So that, our nation will be present on safer and healthy side.

Thanking You in Advance,

Jai Hind,

With Best Regards,

KumaraswamyHollaV
